

# UDMH Attribute Scoping

Created by: Piyush Singh, Sudhir Velaga, Michael Kagori

Reviewer: Venkateswara Chebrolu

Date: Nov 2018

# Agenda

Discuss different approaches to customize UDMH based on requirements and assumptions.

After internal discussion between Kagori, Sudhir and Piyush, two approaches were finalized. A list of pros and cons of each approach is created which will showcase different aspects of customizing UDMH data model

Assumption is only In-Scope entities will be included in logical as well as in physical data model for both approaches

- **Approach 1**

All UDMH attributes will be included in Physical data model

- **Approach 2**

Only In-Scope attributes will be included in Physical data model

## Approach 1 (All UDMH attributes)

### Pros

1. No changes required in the data model.
2. Less maintenance of data model since it would remain unchanged unless there is any modification to existing table or column structure.
3. Minimal Coding and QA Changes required when new attributes from future Sources are to be mapped into target UDMH Column that are not mapped now

### Cons

1. ETL Development (S2T mapping and coding) and QA efforts will increase with number of attributes. E.g. 30 attribute table takes X hours to map, develop and test, 90 attribute table would take least 2X hours
2. Gives incorrect information of the data model since the model would have the columns in the physical data model that do not have any data or logic associated with them to store the data.
3. Overall SLA would be impacted by 10~20%
4. IBM recommends using the data model as a reference and avoid implementing it as is. Approach 1 implements the UDMH as is.

## Approach 2 (Only In-Scope attributes)

### Pros

1. Optimized ETL and QA efforts since the data model truly depicts the correct scope.
2. Clear distinction between Logical and Physical Data Model. Logical Data Model will clearly depict difference between mapped and unmapped UDMH columns (Shown in next slide)
3. Approach 2 is compliant to IBM's recommendation to use UDMH as a reference data model

### Cons

1. Efforts required to ensure out of scope columns don't appear in the physical data model.
2. Data model maintenance efforts are increased.
3. Separate efforts required to add any new attribute

Finalized Approach (11/15/2018)

# Plan Member Detail

- Plan Member Sk [FK]
- Valid From Ts
- Valid To Ts
